

## ARMING PLUG FOR ELECTRICS

I have seen this gadget on several aircraft and it's a good idea so I'm passing it on. This arming plug allows me to install the battery in my aircraft any time before the flight without being connecting it to the ESC. Simply cut one wire, red or black, it doesn't matter which and connect it to the female side of a plug mounted in a handy area on your airplane. Now take the male plug and connect the two poles. See sketch below. To arm simply insert plug into socket. I also hang the male plug on a cord attached to the aircraft, that way I don't misplace it.
